EASY

Features

1. <u>Easy setting, Simple operation</u>

Easy setting, simple operation with the large dial

Just turn and push the large setting dial to browse and select the right parameter. The reference frequency can be also set by the large setting dial.

Parameter can be set without power supply to the inverter

Using the optional parameter writer, you can read/write/ retain/set parameters.

It is useful in case of incorporate numbers of inverters to the machine.

Showing most frequently used parameter in EASY mode.

EASY key allows you switch between EASY mode and Standard mode.

EASY mode: Scrolls through a list of most frequently used parameter.(32 parameters in maximum.) Standard mode: Show all existing parameters.

Long lifetime

Long life main-circuit capacitor is used to achieve 10 years lifetime design.

*Average ambient temperature 40°C, load factor 80% or less, 24-hour and 365 days operation.

Harmonize with environment

- 1. Compliance with the European RoHS Directive.
- 2. Built-in noise filters to suppress electromagnetic noise. 1-Phase 240V models and 3-Phase 500V models: Built-in EMC noise filter complies with the European EMC Directive.

3-Phase 240V models: Built-in basic noise filter.

Side-by-side installation

Side-by-side installation is possible for all VF-S15 models. It means that you can further save space as two or more units can be installed in close proximity next to each other.

3. Energy savings & Powerful operation

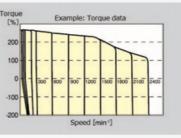

Along with the motor, achieve energy savings.

- 1. High energy saving performance PM motor can be driven normally.
- Auto-tuning can set motor constant easily. 2. Energy saving mode for induction motor.
- Improve the energy saving effect of variable torque load such as fan and pump.

Easy operation of high torque load.

Vector control mode generate stable, high torque power from motor startup to a desired motor operating speed. Further, if you set the starting frequency to 0.1Hz, motor can start smoothly with strength.

When a Toshiba standard 3-phase 400V-1.5kW motor is driven by the VFS15-4015PL-W after parameters are set.

4. <u>Applicability</u>

Auto-tuning can setup motor constant easily.

With vector control mode and PM motor control mode, auto-tuning function leads you easy access to motor constant setup and fully use of all the advantages of motor.

Motor information is required for the auto-tuning:

- •Motor rated capacity (kW)
- •Motor rated current (A)
- •Motor rated speed (min⁻¹)
- •Motor rated Voltage (V) (In case of PM: Induced voltage(RMS between the line) *Please find the information on the motor's name plate.

Easily adjust the lifting application by learning function.

A learning function for setting and storing to memory required parameters while performing actual operations is also provided to facilitate adjustments. Every model is built-in braking resistor drive circuit.

5. Expandability of the system

Built-in RS485 is equipped as standard

Modbus-RTU protocol /TOSHIBA protocol is complied. Communication speed: Maximum 38.4kpbs

Variety of communication options

CC-Link, PROFIBUS-DP, PROFINET, DeviceNet[™], EtherNet/IP[™], EtherCAT[®], CANopen[®]

Useful function and specification

Simplify the system

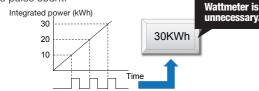

Panel display control

Contents of your requests, such as load condition, could be viewed on the inverter's panel. (Using the communications)

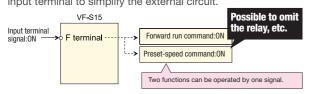

Shows power by the pulse count

Integrated power can be output by the pulse. Even without the external wattmeter, power can be shown by the pulse count.

Flexible terminals

The terminal function settings can be changed. Multiple input terminal functions can be assigned with single input terminal to simplify the external circuit.

Useful for OEM

Parameters can be set easily

Application easy setting

6 parameters for particular usages are available. Parameters match to your machine can be displayed and setup easily by using the application easy setting.

AUA Application easy setting

- 1: Initial easy setting
- 2: Conveyor
- 3: Material handling
- 4: Hoisting
- 5: Fan
- 6: Pump
- 7: Compressor

•Protection of the setting parameters.

VF-S15 provides protection for the setting parameters. Four-digit password is required to reinforce the security. VF-S15 can save and restore a set of parameters.

•Setting from extension parameter writer.

•Setting and management on a PC: PCM002Z. (Refer to Page 4)

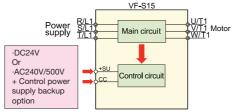

Easy wiring

•Detachable control terminal board Remove the terminal board to wiring efficiently.

Useful to building the system

Control power supply backup

Control power supply is supplied from the inverter's main circuit and also supplied by another input. It can maintain the output signal and trip indication, when the main circuit power supply circuit is also turned off due to inverter trip.

Continuously adjustment from analog input

Can be adjusted continuously by analog input, the value to be set by the parameter.

< Adjustment parameters >

Acceleration/Deceleration time Upper limit frequency Torque boost value Motor electronic-thermal protection level etc.

*For processing by the internal, parameter settings are not changed

International Standards

•Compliant with major international standards

Compatible with the World's Main Standards (EC Directive(CE marking),UL, CSA)

•Sink/Source control logic

It can be configured for both sink logic and source logic. •Built-in EMC filter

1-phase 240V and 3-phase 500V model have built-in noise filter complied with the European EMC Directive.

•Wide variety of applied conditions

Power supply 240V class model is for 200~240V, 500V class model is for 380V~500V. It can correspond to a wide range of power supply

Ambient temperature - It can be used maximum ambient temperature of 60 $^{\circ}C$ \ast_1

Altitude Maximum altitude 3000 meter*1

1 The maximum output current may be limited depend on the operating conditions

Easy maintenance

•Monitor number of starting

Displaying number of starting and output the alarm signal are helpful for maintenance.

•Details on history trip records

Output current, input voltage etc, a monitor to identify the cause of the problem and help to find countermeasures. VF-S15 can keep memories of the last eight trips even after resetting.

• Tracing function (Refer to page 4)

Safety function

Safety function prevents a disaster caused by a complex Machine, not only operator but also machine design regards to safety precaution. It is insulating the output reliability in the event of an emergency. And it can simply the system and reduce the wiring and external devices cost.

Compliant with safety standards:

Possible to disconnect the output corresponding to the safety standard.

- •EN954-1 Category 3
- •IEC61800-5-2/IEC61508 SIL2
- •IEC62061 SIL2 CL •ISO13849-1 Category 3 PL "d"
- •IEC60204-1 Category stop 0,
- PM motor drive technology

The VF-S15 can drive Interior Permanent Magnetic Motor(IPM) and Surface Permanent Magnetic Motor(SPM) for high efficiency, high torque energy saving, downsizing and lightening.

Dual rating (CT/VT)

The VF-S15 can be used the constant torque and variable torque applications by dual rating operation. For example, if variable application (fan and pump) required 15kW drives, it can be operated by 11kW rated of VF-S15.

Constant torque application

The torque value of constant torque application require the high torque level of different motor speed for conveyors, Machine tools, Food machine and Elevator.

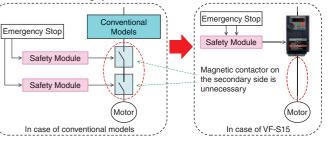

Variable torque application

The torque value of variable torque application such as Fan, Pump and HVAC require low torque unit to operating speed.

Caution: VT mode isn't compliant with UL and CSA standard.

My function

My function enhances programming capability to inverter's input/output signals to respond to customer needs without external relays or a PC in some cases. Easy programming tool (PCL001Z) is available.

•Easy programming(PCL001Z) My function parameter can be set easily by the PCL001Z

Communication

•Built-in RS-485 communications: Modbus-RTU protocol/TOSHIBA protocol.

Note 1. Capacity is calculated at 220V for the 240V models, at 440V for the 500V models. Note 2. Indicates rated output current setting when the PWM carrier frequency (parameter *F* 300) is 4kHz or less. When exceeding 4kHz, the rated output current setting is indicated in the parentheses. It needs to be further reduced for PVM carrier frequencies above 12 kHz. The rated output current is reduced even further for 500V models with a supply voltage of 480V or more. The default setting of the PWM carrier frequency is 12kHz.

Note 3. Maximum output voltage is the same as the input voltage. Note 4. At 180V-264V for the 240V models, at 342V-550V for the 500V models when the inverter is used continuously (load of 100%). Note 5. Required power supply capacity varies with the value of the power supply side inverter impedance (including those of the input reactor and cables).

Please use the OUT terminal as much as possible when the programmable controller is connected. Note 2. Current must be reduced by 1% for each 100 m over 1000 m. For example, 90% at 2000m and 80% at 3000m. Note 3. When using the inverter in locations with temperatures above 40°C, remove the protective label on the top of the inverter and use the inverter with the output current reduced accord-ing to the instruction manual. To align the inverters side-by-side horizontally, remove the protective label on the top of the inverter before use. When using the inverter in locations with temperatures above 40°C, use the inverter with the output current reduced.

*4: When VIA or VIB terminal is used as logic input terminal, refer to the instruction manual.
*5: To supply control power from an external power supply for backing up the control power supplied from the inverter, an optional control power backup device (CPS0022) is required in such a case, the backup device is used at the same time with the internal power supply of the inverter.
The optional control power backup unit can be used with both 240V and 500V models.
*6: Set the slide switch SW1 to sink side or source side Refer to the instruction manual for details. Default setting is PLC side.
*7: When STO terminal is used as compliance with safety standards. Refer to Safety function manual.

Note 1

Note 2: Note 3:

Be sure to attach a surge absorber to the exciting coil of the relay and the magnetic contactor. When using the auxiliary contacts 2a of the magnetic contactor MC for the control circuit, connect the contacts 2a in parallel to increase reliability. Select an MCCB with a rated interrupting current appropriate to the capacity of the power supply, because short-circuit currents vary greatly depending on the capacity of the power supply and the condition of the wiring system. The MCCB, MC and ELCB in this table were selected, on the assumption that a power supply with a normal capacity would be used. Sizes of the wires connected to the input terminals R/L1, S/L2 and T/L3 and the output terminals U/T1, V/T2 and W/T3 when the length of each wire does not exceed 30m. For the control circuit, use shielded wires 0.75 mm² or more in diameter.

Note 5: Note 6: Note 7:

For grounding, use a cable with a size equal to or larger than the above. The wire sizes specified in the above table apply to HIV wires (copper wires shielded with an insulator with a maximum allowable temperature of 75°C) used at an ambient temperature of 50°C or less.

To users of our inverters

1. For inverter users Notes

Leakage current

This inverter uses high-speed switching semiconductors for PWM control. When a relatively long cable is used for power supply to an inverter, current may leak from the cable or the motor to the ground because of its capacitance, adversely affecting peripheral equipment. Installation of radio noise reduction filter may also increase leakage current. The intensity of such a leakage current depends on the PWM carrier frequency setting, the lengths of the input and output cables, etc., of the inverter. To prevent current leakage, it is recommended to take the following measures.

[Effects of leakage current]

Leakage current which increases when an inverter is used may pass through the following routes:

- Route (1) ... Leakage due to the capacitance between the ground and the noise reduction filter Route (2) ... Leakage due to the capacitance
- between the ground and the inverter Route (3) ... Leakage due to the capacitance

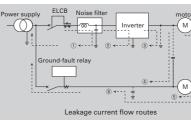

between ground and the cable connecting the inverter and the motor

Route (4) ... Leakage due to the capacitance of the cable connecting the motor and an inverter in another power distribution line

Route (5) ... Leakage through the grounding line common to motors

Route (6) . Leakage to another line because of the capacitance of the ground Leakage current which passes through the above routes may cause the following

- troubles · Malfunction of a leakage circuit breaker(ELCB) in the same or another
- power distribution line Malfunction of a ground-relay installed in the same or another power distribution line
- · Noise produced at the output of an electronic device in another power distribution line
- Activation of an external thermal relay installed between the inverter and the motor, at a current below the rated current.

[Measures against effects of leakage current]

The measures against the effects of leakage current are as follows:

- 1) Measures to prevent the malfunction of leakage circuit breakers (ELCB) (1) Decrease the PWM carrier frequency of
- the inverter. Note) (2) Use radio-frequency interference-proof ELCBs as ground-fault interrupters

in not only the system into which the inverter can operate with high PWM carrier frequency.

- (3) When connecting multiple inverters to a single ELCB, use an ELCB with a high current sensitivity or reduce the number of inverters connected to the
- ELCB. 2) Measures against malfunction of groundfault relay:
- the inverter. Note)

(2) Install ground-fault relays with a highfrequency protective function in both the same and other lines. When ELCBs are used, the inverter can operate with high PWM carrier frequency. 3) Measures against noise produced by other

electric and electronic systems: (1) Separate the grounding line of the inand electronic systems

(2) Decrease the PWM carrier frequency of the inverter. Note) 4) Measures against malfunction of external

thermal relays: (1) Remove the external thermal relay and use the electronic thermal function of the inverter instead (Not apply to cases where a single inverter is used to drive more than one motor. Refer to the instruction manual for measures to be taken when thermal relays cannot be removed.)

(2) Decrease the PWM carrier frequency of the inverter. Note) 5) Measures by means of wiring and ground-

(1) Separate the inverter's grounding wire

- grounding wire of each system separately to the grounding point.
- or less) to connect the inverter to the motor. If the wire length is long, espeperhaps over current trip occurs by charging current through the capaciinstall the reactor or the filter between the inverter and the motor as counter-
- measures against over current trip. (3) If the inverter has a high-attenuation EMC noise reduction filter, change the grounding capacitor switch to reduce the leakage current. Note that doing so leads to a reduction in the noise attenuating effect.
- Note)

Ground fault

Before beginning operation, thoroughly check the wiring between the motor and the inverter for incorrect wiring or short circuits. Do not ground the neutral point of any starconnected motor.

Radio interference

[Noise produced by inverters] Since this inverter performs PWM control, it produces noise and sometimes affects nearby instrumental devices, electrical and

In the case of this inverter, the PWM carrier frequen-cy can be decreased to 2.0kHz. Decrease the carrier frequency results in an increase in electromagnetic noise from the motor.

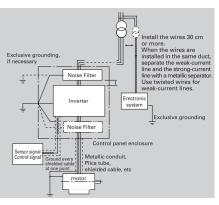

electronic systems, etc. The effects of noise greatly vary with the noise resistance of each individual device, its wiring condition, the distance between it and the inverter, etc. [Measures against noises]

According to the route through which noise is transmitted, the noises produced by an inverter are classified into transmission noise, induction noise and radiation noise. [Examples of protective measures]

· Separate the power line from other lines. such as weak-current lines and signal lines, and install them apart from each other.

- Install a noise reduction filter in each inverter. It is effective for noise prevention to install noise reduction filters in other devices and systems, as well.
- Shield cables and wires with grounded metallic conduits, and cover electronic systems with arounded metallic cases.
- Separate the power distribution line of the inverter from that of other devices and systems.
- Install the input and output cables of the inverter apart from each other.
- Use shielded twisted pair wires for wiring of the weak-current and signal circuits, and always ground one of each pair of wires.
- Ground the inverter with grounding wires as large and short as possible, separately from other devices and systems.

On 1ph-240V and 3ph-500V models, noise can be greatly reduced as they have a builtin EMC noise reduction filter on their input side

Power factor improvement capacitors

Do not install power factor improvement capacitors on the output side of the inverter. Installing a power factor improvement capacitor on the output side causes current containing harmonic components to flow into the capacitor, adversely affecting the capacitor itself or causing the inverter to trip. To improve the power factor, install a DC reactor or an input AC reactor on the primary side of the inverter.

Installation of input AC rectors

These devices are used to improve the input power factor and suppress high harmonic currents and surges. Install an input AC reactor when using this inverter under the following conditions:

(1) When the power source capacity is 500kVA or more, and when it is 10 times or more greater than the inverter capacity.

- (2) When the inverter is connected the same power distribution system as a thyristorcommitted control equipment.
- (3) When the inverter is connected to the same power distribution system as that of distorted wave-producing systems, such as arc furnaces and large-capacity inverters.

2. Selecting the Capacity (model) of the Inverter

Selection

[Capacity]

Refer to the applicable motor capacities listed in the standard specifications. When driving a high-pole motor, special motor, or multiple motors in parallel, select such an inverter that the sum of the motor rated current multiplied by 1.05 to 1.1 is less than the inverter's rated output current value.

[Acceleration/deceleration times]

The actual acceleration and deceleration times of a motor driven by an inverter are determined by the torque and moment of inertia of the load, and can be calculated by the following equations. The acceleration and deceleration times of

an inverter can be set individually. In any case, however, they should be set longer than their respective values determined by the following equations.

Acceleration time	ta= (JM+JL) x ΔN 9.56 x (TM-TL)(sec.)
Deceleration time	$ta = \frac{(JM+JL) \times \Delta N}{9.56 \times (TB+TL)} (sec.)$
Conditions	JM :Moment of inertia of motor (kg·m ²) JL :Moment of inertia of load (kg·m ²) (converted into value on motor shaft) ΔN :Difference in rotating speed between before and after acc. or dec. (min ⁻¹) TL :Load torque (N·m) TM :Motor rated torque x 1.2-1.3 (N·m)V/f control :Motor rated torque x 1.5 (N·m)Vector operation control [In case of variable torque characteristic TM :Motor rated torque x 1.1 (N·m)V/f control :Motor rated torque x 1.2 (N·m)Vector operation control] TB :Motor rated torque x 1.2 (N·m)Vector operation control] TB :Motor rated torque x 0.2 (N·m) (When a braking resistor or a braking resistor unit is used: Motor rated torque x 0.8-1.0 (N·m))

[Allowable torque characteristics]

When a standard motor is combined with an inverter to perform variable speed operation. the motor temperature rises slightly higher than it normally does during commercial power supply operation. This is because the inverter output voltage has a sinusoidal (approximate) PWM waveform. In addition, the cooling becomes less effective at low speed, so the torque must be reduced according to the frequency. Regarding the allowable torque characteristic, please confirm with the motor manufacturer.

When constant-torgue operation must be performed at low speeds, use a Toshiba constant-torque motor designed specifically for use with inverters.

[Starting characteristics]

When a motor is driven by an inverter, its operation is restricted by the inverter's overload current rating, so the starting characteristic is different from those obtained from commercial power supply operation. Although the starting torque is smaller with an inverter than with the commercial power supply, a high starting torque can be produced at low speeds by adjusting the V/f pattern torque boost amount or by employing vector control. When a larger starting torque is necessary, select an inverter with a larger capacity and examine the possibility of increasing the motor capacity.

3. When installing, wiring and operating the inverter

Installing and wiring

[Installing precautions]

- (1) Do not install in any location of high temperature, high humidity, moisture condensation and freezing. Do not install the inverter where there are gases that corrode metal or solvents that adversely affect plastic.
- Avoid locations where there is exposure to water and/or where there may be large amounts of dust and metallic fragments. In this case, please install inverters in the enclosure type cabinet. The cabinet must be considered its size and the cooling method to allow the specifications of an ambient temperature for inverters.
- (2) Must be installed in non-inflammables such as metals. The rear panel gets very hot. If installation is in an inflammable object, this can result in fire.
- (3) Inverters should be arranged in horizontal rows.

[Wiring precautions]

F (or R)-CC.

- Installing a molded-case circuit breaker [MCCB] (1) Install a molded-case circuit breaker
- (MCCB) on the inverter's power supply input to protect the wiring. (2) Avoid turning the molded-case circuit breaker on and off frequently to turn on/ off the motor. To turn on/off the motor frequently, close/break the control terminals

Installing a magnetic contactor [MC] [primary side]

- (1) To prevent an automatic restart after the power interruption or overload relay has tripped, or actuation of the protective circuit, install an electro-magnetic contact in the power supply.
- (2) The inverter is provided with a failure detection relay (FL), so that, if its contacts are connected to the operation circuit of the magnetic contactor on the primary side, the magnetic contactor will be opened when the protective circuit of the inverter is activated.
- (3) The inverter can be used without a magnetic contactor. In this case, use an MCCB (equipped with a voltage tripping device) for opening the primary circuit when the inverter protective circuit is activated.
- (4) Avoid turning the magnetic contactor on and off frequently to turn on/off the motor. To turn on/off the motor frequently, close/
- break the control terminals F (or R)-CC. (5) Install surge suppressor on any magnetic contactor and relay coils used around the inverter.
- (6) If using a braking resistor, install a magnetic contactor (MC) to the power supply of the inverter, so that the power circuit opens when the internal overload relay of the braking resistor is activated.

Installing a magnetic contactor [MC] [secondary sidel

(1) As a rule, if a magnetic contactor is installed between the inverter and the motor. do not turn on/off while running. (If the secondary-side contactor is turned on/off while running, a large current may

flow in the inverter, causing inverter damage and failure.)

(2) A magnetic contactor may be installed to change the motor or change to the commercial power source when the inverter is stopped. Always use an interlock with the magnetic contactor in this situation so that the commercial power supply is not applied to the inverter's output terminals.

External signal

- (1) Use a relay rated for low currents. Mount a surge suppressor on the excitation coil of the relay.
- (2) When wiring the control circuit, use shielded wires or twisted pair cables. (3) Because all of the control terminals
- except FLA. FLB. FLC. RY or RC are connected to electronic circuits, insulate these terminals to prevent them from coming into contact with the main circuit.

Installing an overload relay

- (1) This inverter has an electronic-thermal overload protective function. However, in the following cases, the thermal relay operation level must be adjusted or an overload relay matching the motor's characteristics must be installed between the inverter and the motor.
- (a) When using a motor having a rated current value different from that of the equivalent.
- (b) When driving several motors simultaneously.
- (2) When using the inverter to control the operation of a constant-torque motor, change the protective characteristic of the electronic thermal relay according to the setting of the constant-torgue motor.
- (3) In order to adequately protect a motor used for low-speed operation, we recommend the use of a motor equipped with an embedded thermal relay.

Wiring

- (1) Do not connect input power to the output (motor side) terminals (U/T1.V/T2.W/T3). That will destroy the inverter and may result in fire. Please pay attentions of wiring before power supply turns-on.
- (2) The DC terminals (PA/+, PO and PB) are for specified options. Do not connect other devices to these terminals.
- (3) Within 15 minutes after turning off input power, do not touch wires of devices (MCCB) connected to the input side of the inverter.

Grounding

The inverters and motors must be connected to ground securely. In case of grounding for inverters, please use the grounding terminal of the inverter

Operating precautions

- (1) When the inverter operates in abnormal circumstances, the protective function activates to shut off the inverter output. However, the inverters can not stop the motors quickly. Please install the mechanical brake or maintenance function in the mechanical equipment and the device for which the emergency stop is necessarv.
- (2) When you drive the machine and the device that hangs the load repeatedly with the inverter, the semiconductor within inverter might cause thermal fatigue and it come to have a short life if a big current flows repeatedly when driving and stopping. In this case, it is possible to extend life span by controlling the start-

ing current and the load current low or setting the PWM career frequency low. If you can not decrease the starting current, please select larger capacity of inverters for current margins.

4. When changing the motor speed

Application to standard motors Vibration

When a motor is operated with an inverter, it experiences more vibrations than when it is operated by the commercial power supply. The vibration can be reduced to a negligible level by securing the motor and machine to the base firmly.

If the base is weak, however, the vibration may increase at a light load due to resonance with the mechanical system. In this case, using jump frequency to avoid resonant frequencies or changing PWM carrier frequency is also effective.

Acoustic noise

The magnetic noise of motors with inverter drives is changed by PWM carrier frequency. In case of high PWM carrier frequency settings, its acoustic noise is almost same as commercial power supply drives. Moreover, when the motors are operated over rated rotation, the windy noise of the motors is increased.

Reduction gear, belt, chain

Note that the lubrication capability of a reducer or a converter used as the interface of the motor and the load machine may affect at low speeds.

When operating at frequencies exceeding 60 Hz or higher, power transmission mechanisms such as reduction gear, belts and chains, may cause problems such as production of noise, a reduction in strength, or shortening of service life.

Frequency

Before setting the maximum frequency to over 60 Hz, confirm that this operating range is acceptable for the motor.

Starting method

When you drive the motor with changeable connection between star-connection and delta-connection for decreasing starting current, please connect delta-connection only. If you change motor connection while inverter drives, the protective function of inverter activates.

Application to special motors

Geared motor

When using an inverter to drive a geared motor, inquire of the motor manufacturer about its continuous operation range due to the followings:

- The low-speed operation of a geared motor may cause insufficient lubrication
- The loss of a gear may be increased than commercial power supply drives.
- In case of the operation on high frequency exceeding 60Hz, the acoustic noise and motor temperature may be higher.

Pole-changing motor

Pole-changing motors can be driven by this inverter. Before changing poles, however, be sure to let the motor come to a complete stop. If you change motor connection while inverter drives, the protective function of inverter may activate.

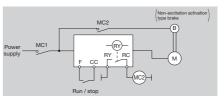

21

Brake motor

Single-phase motor

Underwater motors

When using a brake motor, if the braking circuit is directly connected to the inverter's output terminals, the brake cannot be released because of the lowered starting voltage. Therefore, when using a brake motor, connect the braking circuit to the inverter's power supply side, as shown on the below. Usually, brake motors produce larger noise in low speed ranges.

5. Disposal of the inverter

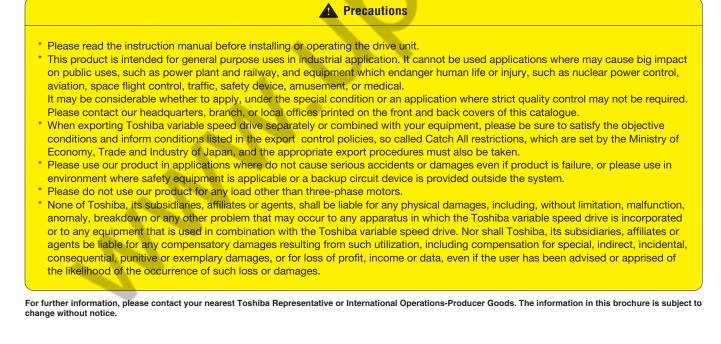

used inverter vourself but ask an industrial waste disposal agent. Disposing of the inverter improperly could cause its capacitor to explode and emit toxic gas, causing injury to persons.

Note that underwater motors have higher rated current than general motors. The current ratings of underwater motors are relatively high. So, when selecting an inverter, you must pay special attention to its current rating so that the current rating of the motor is below that of the inverter. When the lengths of the motor cable are long, please use thicker cable than a table of "Wiring devices" because the maximum torque is decreased by the voltage dropping. Moreover, please pay attention to select leakage circuit breakers.

Because single-phase motors are equipped with a centrifugal switch and capacitors for starting, they cannot be driven by an inverter. When single phase motors are driven by inverters, a centrifugal switch and capacitors may be broken. In case of a single-phase, power system, a 3-phase motor can be driven by using a single-phase input inverter to convert it into a 3-phase 200V output. (A special inverter and a 3-phase 200V motor

For safety's sake, do not dispose of the dis-
